## *“Modeling and Rapid Prototyping of Cellular Solids“*

### **Project partners**

- Institute of Lightweight Design and Structural Biomechanics, Vienna University of Technology, Austria
- Institute of Materials Science and Technology, Vienna University of Technology, Austria
- Max Planck Institute of Colloids and Interfaces, Potsdam, Germany

Supported by the Austrian Science Fund (Grant P15852)

## Mechanical behavior of cellular structures

- different generic geometries
- fully 3D
- elastic–plastic bulk material
- Finite Element Method

## Regular vs. perturbed geometries

- → inspired by nature

## Nonlinear behavior

- deformation localization

- 1 PROJECT
- 2 STRUCTURES / MODELING APPROACHES**
- 3 LINEAR ELASTIC BEHAVIOR
- 4 NONLINEAR BEHAVIOR
- 5 SUMMARY

## **Six generic geometries — relative density 12.5%**

- open cell structures
- based on regular arrangements (lattice structures)
- struts with circular cross sections
- fabricated by Rapid Prototyping (SLS & SLA)
- crosslinked photopolymer

# Structures — Base Cells

Simple Cubic (SC)

Gibson Ashby (GA)

Reinforced Body Centered Cubic (RBCC)

Body Centered Cubic (BCC)

Kelvin (KV)

Weaire Phelan (WP)

# Modeling Approaches

## Two modeling approaches

- unit cell models
- finite structure models

## Unit cell models

- only the periodic part is modeled
  - 1 base cell for regular structures
  - 8x8x8 base cells for perturbed structures
- periodic microfield approach
- periodic boundary conditions (also coupling of rotational DOFs)

## Finite structure models

- consist of a given number of base cells
- various lattice orientations
- approx.  $32\text{mm} \times 32\text{mm} \times 32\text{mm}$
- boundary conditions correspond with experimental setup (uniaxial compression tests)
- used for nonlinear studies

# Finite Structure Models

## Experimental setup / Boundary conditions

- uniaxial compression in  $[001]$  direction
- stiff top and bottom plate for load application
- bottom plate is fixed / top plate can move freely normal to  $[001]$  and rotate around  $[001]$

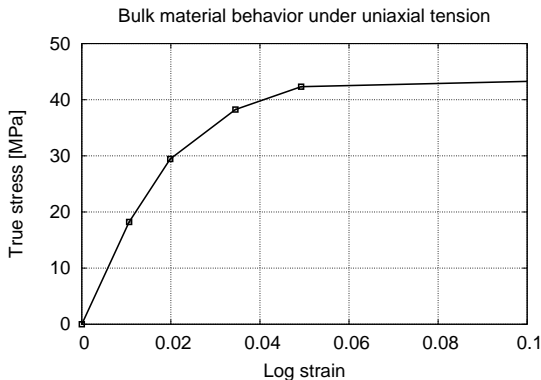

## Beam elements

- timoshenko beams
- density approximation for determination of beam radius
- stiffness correction to account for material accumulation in the vicinity of the vertices
  
- previous studies

## Crosslinked photopolymer for rapid prototyping

- elastic-plastic behavior
- $E = 1700\text{MPa}$ ,  $\nu = 0.3$ ,  $\sigma_Y = 18\text{MPa}$
- no viscosity is considered

- 1 PROJECT
- 2 STRUCTURES / MODELING APPROACHES
- 3 LINEAR ELASTIC BEHAVIOR**
- 4 NONLINEAR BEHAVIOR
- 5 SUMMARY

# Linear Elastic Behavior

Simple Cubic (SC)

Gibson Ashby (GA)

Reinforced Body Centered Cubic (RBCC)

Normalized Young's modulus

0.0063      0.0363      0.0663

Normalized Young's modulus

0.0036      0.0072      0.0108

Normalized Young's modulus

0.0239      0.0265      0.0291

# Linear Elastic Behavior

Body Centered Cubic (BCC)

Kelvin (KV)

Weaire Phelan (WP)

Normalized Young's modulus

Normalized Young's modulus

Normalized Young's modulus

**For the two structures with lowest and highest anisotropy:**

**8x8x8 base cells as unit cell**

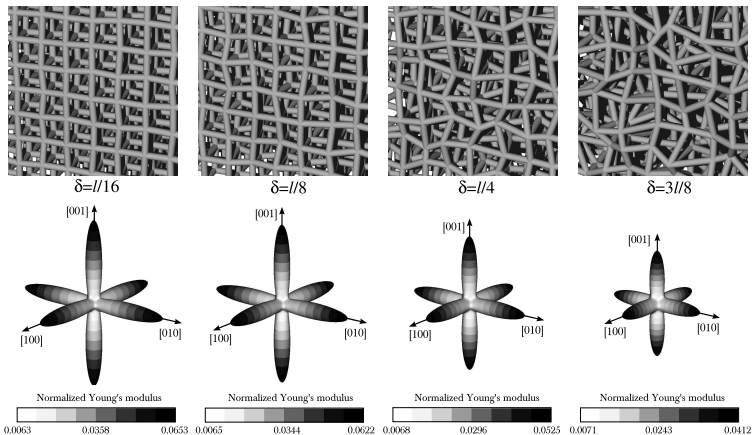

**Random shift of vertices**

- direction 3D random
- distance fixed as  $\delta/l = 1/16; 1/8; 1/4; 3/8$

**Correction for density of 12.5%**

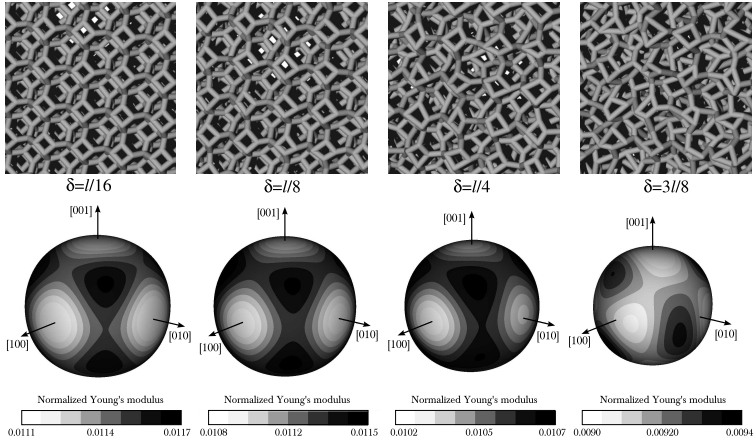

# Linear Elastic Behavior

## Perturbations — Simple Cubic structure

# Linear Elastic Behavior

## Perturbations — Kelvin structure

# Outline

- 1 PROJECT
- 2 STRUCTURES / MODELING APPROACHES
- 3 LINEAR ELASTIC BEHAVIOR
- 4 NONLINEAR BEHAVIOR**
- 5 SUMMARY

# Nonlinear Behavior

## Deformation localization

- ... no longer with periodic unit cells

## Finite samples

- uniaxial compression
- four lattice orientations

## BCs in accordance with experiments

- top, bottom with rigid plate — no tilting, but twisting
- free side faces

## Elastic–plastic bulk material

## No contact

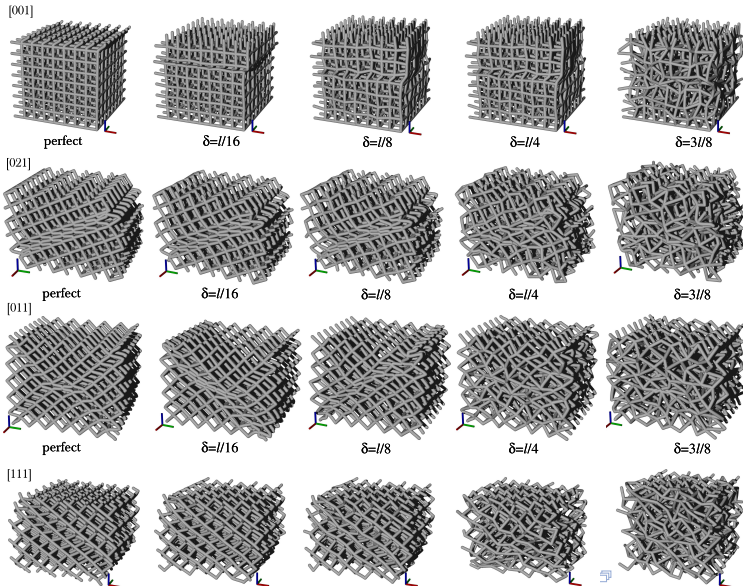

# Simple Cubic — Perfect Geometry

## Deformation localization

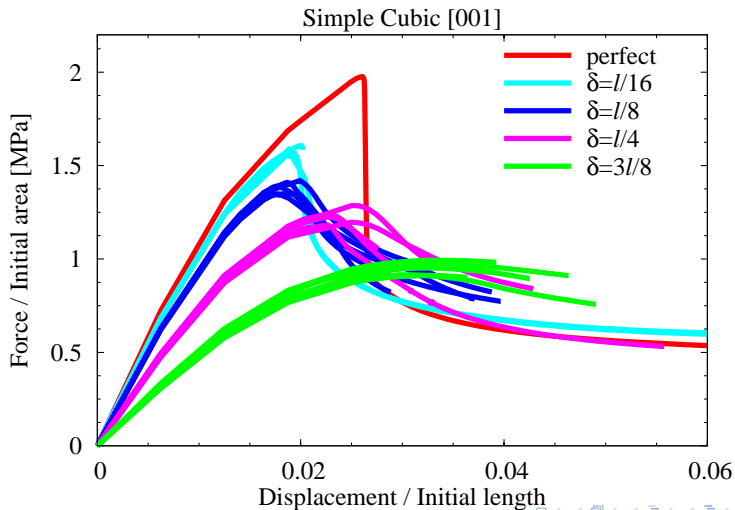

# Simple Cubic — Perturbations

# Simple Cubic — Load–Displacement

# Simple Cubic — Load–Displacement

# Energy Distribution

Simple Cubic [001] —  $\delta/l = 1/16$

# Energy Distribution

Simple Cubic [001] —  $\delta/l = 3/8$

# Kelvin — Load Displacement Curves

# Outline

- 1 PROJECT
- 2 STRUCTURES / MODELING APPROACHES
- 3 LINEAR ELASTIC BEHAVIOR
- 4 NONLINEAR BEHAVIOR
- 5 SUMMARY**

**3D open cell structures**

**Regular geometries**

**Influence of structural perturbations**

**Linear elastic behavior — unit cells**

**Nonlinear behavior — finite samples**

- deformation localization
- force displacement curves
- energy distribution

# Young's moduli — Perfect Structures

	$E^*/E_s \cdot 10^{-2}$			
	[001]	[021]	[011]	[111]
SC	6.630	1.193	0.816	0.631
